INTRODUCTION

- A principle deficit in people with aphasia (PWA) is anomia (Goodglass & Wingfield, 1997)
- Dell et al. (1997) demonstrated that lexical access in PWA can be modeled by increasing the noise or weakening the connections between the semantic layer and phonological layer.
- In support of this theory, researchers using single concepts have determined that PWA have easier time accessing words that:
 - Have a higher frequency (Dede, 2012, Haley & Jacks, 2014)
 - Are more imaginable/concrete (Kiran et al., 2009)
 - Are more familiar (DeDe, 2012)
 - Acquired at an earlier age (Hirsh & Funnel, 1995).
- Currently, no one has measured lexical production within a discourse task in respects to word frequency, imaginability/concreteness, familiarity, or age of acquisition.

METHOD

Discourse Measure:

Cinderella (Grimes, 2005)

Noun Extraction in CLAN:

Separate Cinderella Narrative:
 gem +t*PAR +sCinderella +d +
 +2 +n *.cha

Generate Morphological Analysis:

mor +t*PAR *.gem.cex

Generate Syntactic Categories:

post +t*PAR *gem.mor.cex

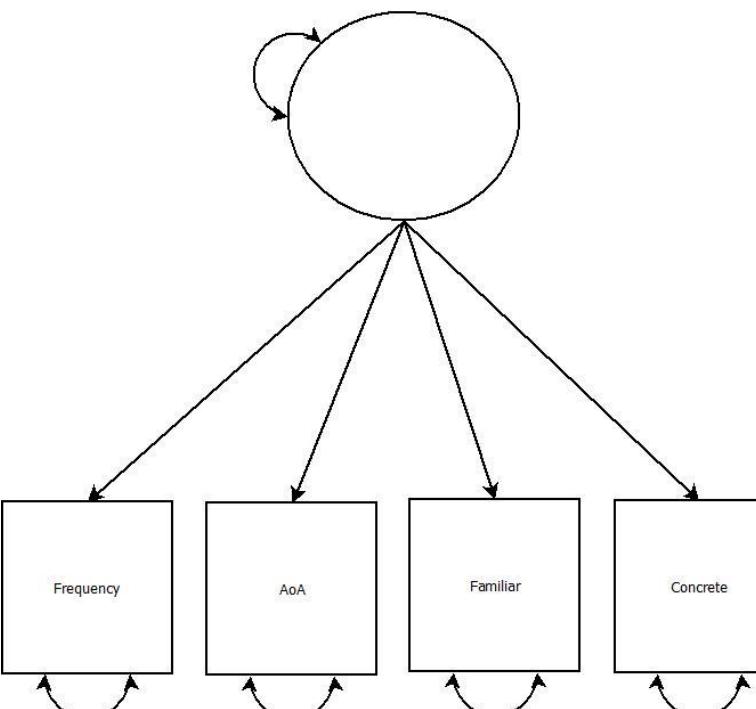

Noun Extraction:

freq +t%mor +s"n|** +s"n:** +d2 *.gem.mor.pst.cex

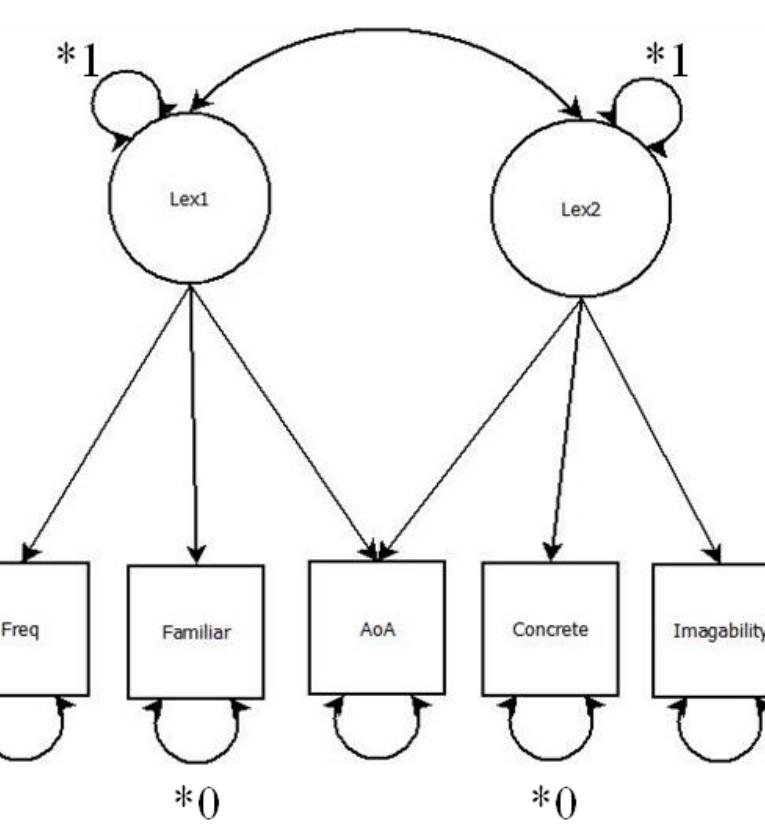

Clearpond Database & MRC Psycholinguistic Database

- Frequency: How often a word is used
- Imagability/Concreteness: How easy it is to picture the word
- Age of Acquisition: Mean age of acquiring a word
- Familiarity: How familiar the concept is to individuals

1-Factor Model

2-Factor Model

2-Factor Model Invariance Testing

	Configural	Weak	Strong
χ^2	(10) = 33.58, p < .001	(14) = 40.12, p < .001	(17) = 49.67, P = .023
RMSEA	.145	.129	.131
SRMR	.045	.061	.074
CFI	.964	.960	.950
TLI	.928	.943	.941
$\Delta\chi^2$		(4) = 6.5468, (5) p = .16	(3) = 9.547, p = .023
ΔCFI		.004	.01

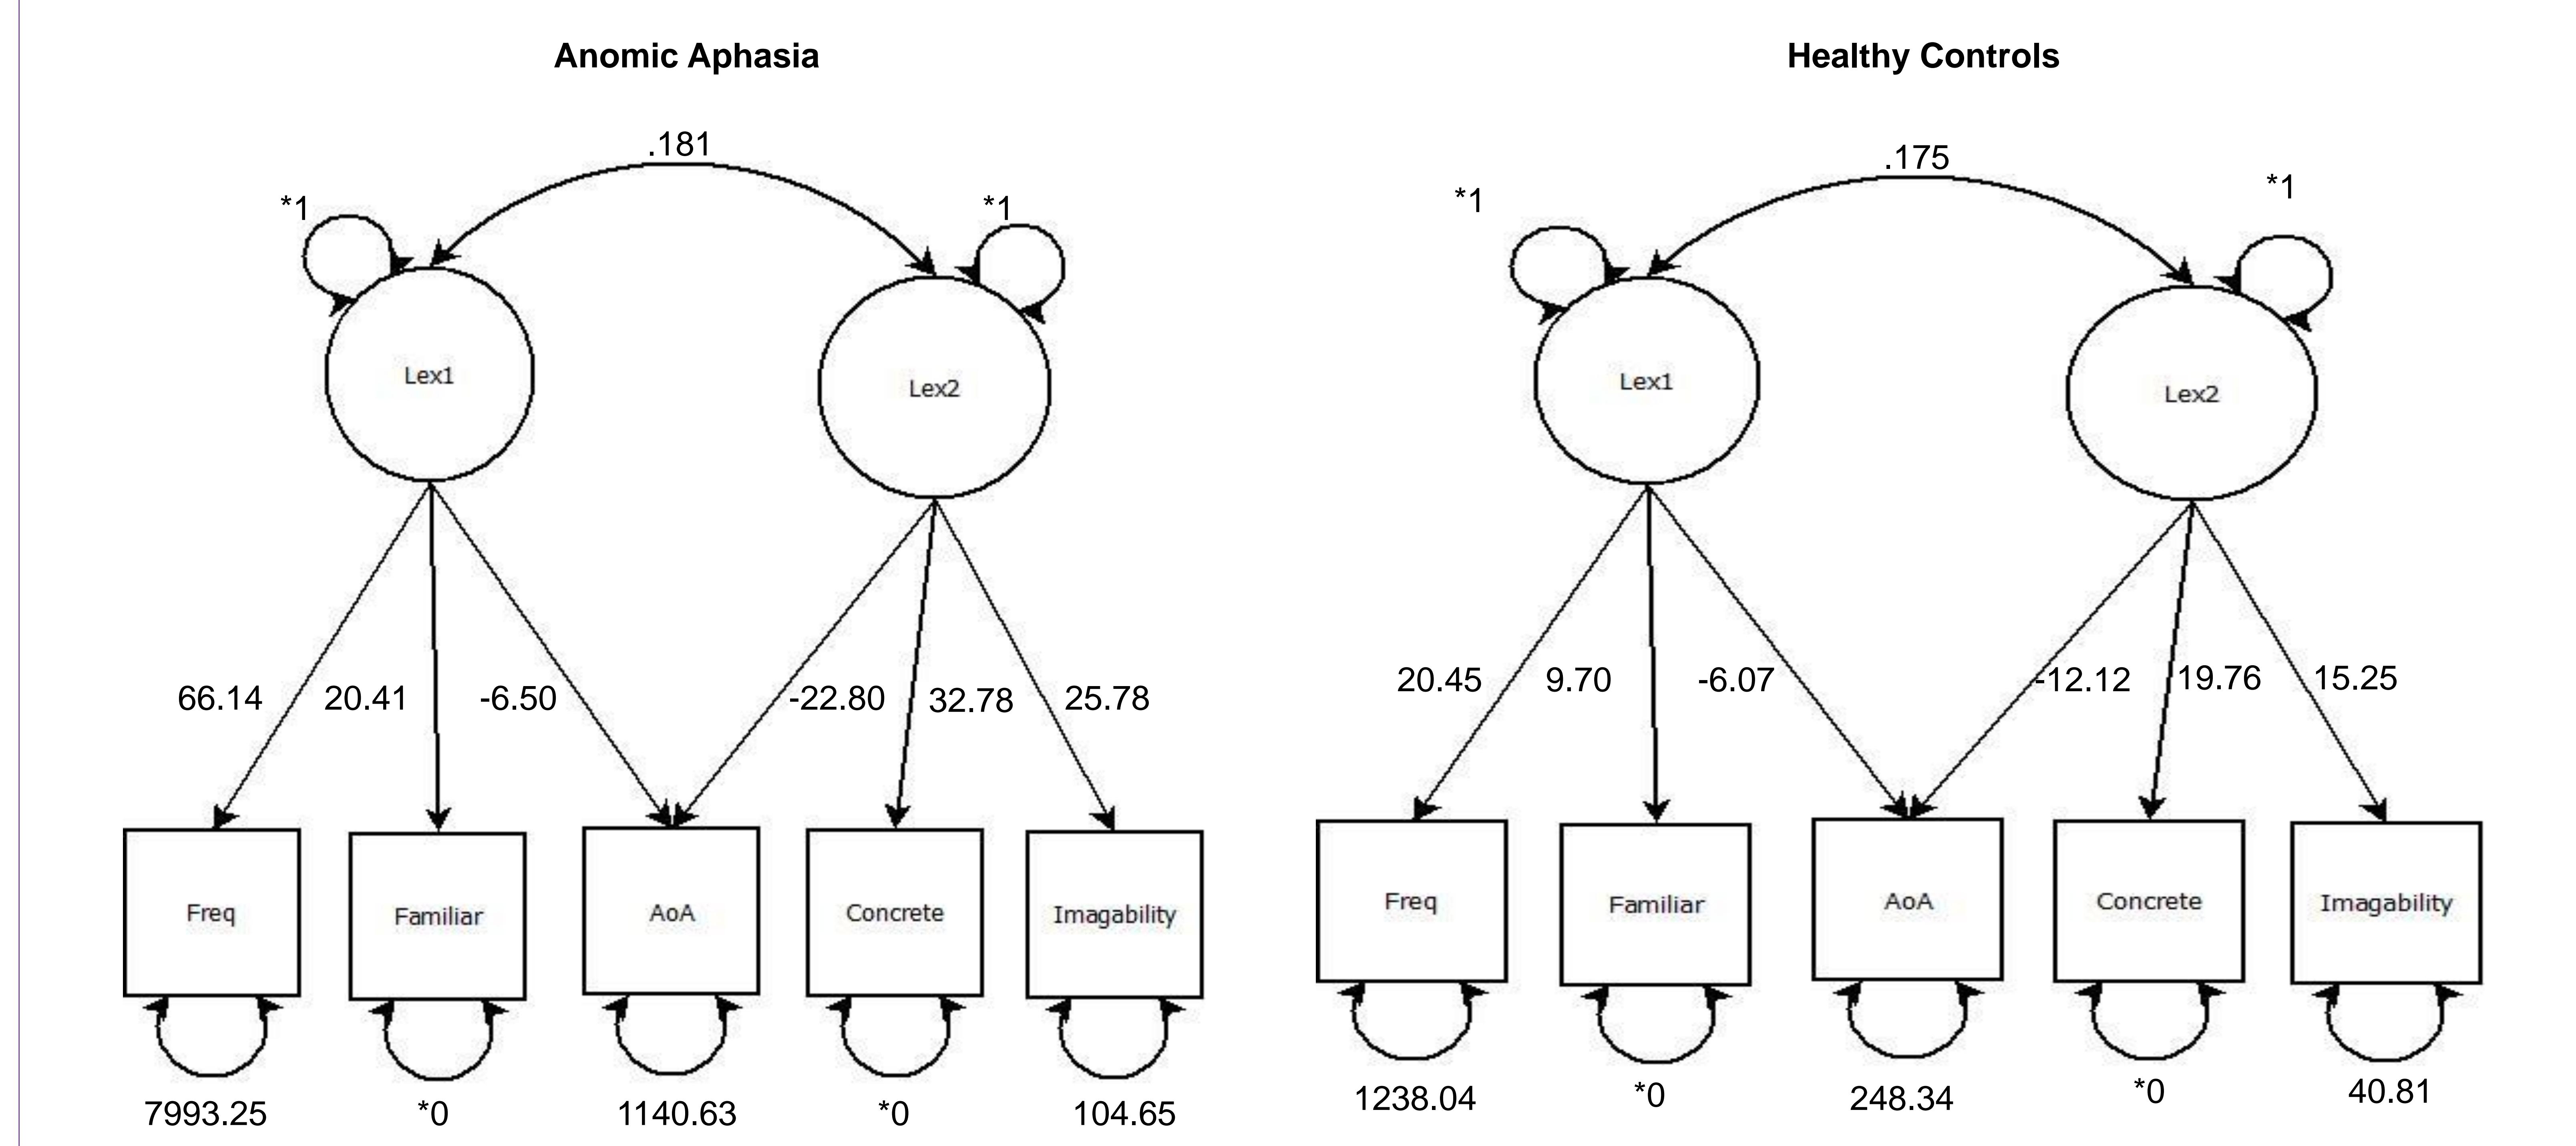

DISCUSSION

- The Configural Model indicated that the groups have a similar factor structure.
- The Weak Invariance Model indicated that the groups had similar factor loadings.
- The Strong Invariance Model indicated that the latent means differed.
- The similar factor structure and loadings agree with Dell et al. (1997) who suggested that PWA and healthy controls have a similar cognitive apparatus when accessing lexical items.
- The results extend connection strength research into the realm of narrative discourse.
- The factor loading agree with single concept research that suggest to overcome the noise within the lexical access system, lexical items need to be:
 - more frequent
 - more familiar
 - more concrete
 - acquired earlier.
- Discourse is more sensitive than standardized tests (Marini et al., 2011), and the current study extends the usefulness of discourse samples in assessing lexical access.
- Future research should determine if this method of assessing lexical access is correlated with other standardized tests of lexical access and aphasia impairment.

Purpose and Hypothesis

- Purpose: Determine if people with anomic aphasia produce nouns within narrative discourse that have higher frequency, higher imaginability, higher familiarity, and a younger age of acquisition compared to healthy controls.
- Hypothesis: PWA will produce nouns that require higher frequencies, imaginability, and familiarity, as well as, words that are acquired earlier in life within narrative discourse.

RESULTS

Participants

Anomic Aphasia (N=114)	Control (N=112)
F:M	52:62
Age (SD)	62.89 (11.85) 56.33 (16.25)
Education (SD)	16.00 (2.83) 15.62 (2.25)
WAB AQ	84.36 (7.01) N/A

- PWA had left hemisphere damage, anomic aphasia, chronic aphasia, no reported history of neurodegenerative disorders, and passed hearing and visual screenings
- Controls had no history of stroke or head injury, passed hearing and visual screenings, and had normal cognitive function as indicated by MMSE
